

LCB TRAINING

ROTATIONAL POWER PROGRAM

Baseball Performance Training

Develop the explosive hip rotation and rotational strength that creates elite bat speed and throwing power.

3 Complete Rotational Workouts

Program Overview

Disclaimer

This program is designed for healthy individuals. Consult a physician before beginning any new exercise program. Stop immediately if you experience pain or discomfort. LCB Training is not responsible for any injuries. Proper form always takes priority over speed or intensity.

The LCB Rotational Power Program is built specifically for baseball athletes who want to develop explosive hip rotation, elite bat speed, and powerful throwing mechanics. Every drill in this program is designed to train the exact movement pattern you use when you swing a bat or throw a baseball — loading into your back hip, rotating through your core, and finishing with full extension.

What you will develop:

- Hip loading and separation — the foundation of all rotational power
- Explosive core rotation for maximum bat speed and exit velocity
- Sequencing from lower half to upper half for efficient energy transfer
- PVC pipe mechanics to ingrain proper swing path and rotation
- Med ball explosiveness to translate rotation into real power

Program Structure

Three complete rotational workouts. Each session begins with a dynamic warm-up and PVC pipe work to groove mechanics, followed by three explosive med ball circuits. Sessions are 30-45 minutes. Perform 2-3 times per week with at least one rest day between sessions.

Exercise Glossary

PVC Pipe Swing

A full swing motion performed with a lightweight PVC pipe instead of a bat. Used to train proper mechanics, hip loading, and rotation without the weight of a bat interfering with the movement pattern.

Athletic PVC Pipe Swing

Same as the standard PVC pipe swing but initiated with a small two-foot hop. The hop creates momentum that mimics a stride and forces the athlete to time their rotation off a dynamic movement, just like in a real at-bat.

Rotational Wall Throw

A med ball exercise where the athlete stands sideways to a wall and throws the ball into the wall using hip rotation. The wall absorbs the throw and returns the ball. Trains the exact rotational pattern used in hitting and throwing.

Hip Toss

A med ball drill focusing on driving rotation from the hips rather than the arms. The ball is released at hip level to reinforce the feel of lower half power generation.

Scoop Toss

A med ball drill where the ball starts low and is scooped upward using hip rotation. Trains the upward launch angle and hip-driven power transfer common in a good swing path.

Half Kneeling Rotational Throw

Performed with the trail knee on the ground to isolate upper body rotation. Removes the lower half from the movement to specifically train core and thoracic rotation.

Med Ball Slam with Rotation

The athlete raises the med ball overhead and slams it to the ground with a rotational component, targeting the opposite side. Trains explosive deceleration and rotational core strength.

Drop Step Rotational Throw

The athlete drops the back foot to load the hips before rotating and throwing the med ball. Closely mimics the mechanical sequence of a baseball swing.

Pallof Press with Rotation

An anti-rotation core exercise using a band or cable. The athlete presses the band straight out, then rotates away from the anchor point. Trains the core's ability to resist and then produce rotation.

Overhead Rotational Slam

Med ball is raised overhead and slammed to alternating sides. Combines overhead reach with rotational power and trains the full kinetic chain from shoulder to hip.

Step and Throw

The athlete steps toward the target wall and throws the med ball using full rotational mechanics. The step mimics a stride and trains proper weight transfer into rotation.

Broad Jump to Rotational Throw

The athlete performs a broad jump forward, lands, and immediately rotates to throw the med ball. Trains the explosive transition from linear momentum to rotational power.

Single Leg Rotational Throw

The athlete balances on the front leg and rotates to throw. Challenges hip stability and balance through the finish of the rotation, mimicking the front leg block in a baseball swing.

Low to High Rotational Throw

The ball starts outside the trail hip low and is released high across the body following a diagonal path. Closely mirrors the upswing bat path of a baseball hitter.

Max Effort Wall Throw

Full wind up rotational throw into a wall at maximum effort. Used to train peak power output. Quality and full reset between reps is essential — never sacrifice mechanics for speed.

Hip to Shoulder Separation

The key mechanical concept where the hips begin rotating before the shoulders. This separation creates a stretch across the core that stores elastic energy and releases it explosively through the swing or throw.

Kinetic Chain

The sequence of body segments working together to produce and transfer force — from the ground through the legs, hips, core, and out through the hands. A proper kinetic chain maximizes power while minimizing injury risk.

Front Leg Block

When the front leg straightens and firms up during the swing, stopping forward momentum and redirecting energy upward and into rotation. A strong front leg block significantly increases rotational power and bat speed.

Workout 1 — Hip Load & Drive

Focus: loading into the back hip and driving rotation from the ground up. This is the foundation of all rotational power. Move with intention on every rep.

Warm-Up & PVC Pipe Work

Exercise	Sets x Reps	Load	Coaching Cue
Hip Circle (each leg)	2 x 10 each	Bodyweight	Slow controlled circles, maximize range, stay balanced
Leg Swing (front to back)	2 x 10 each	Bodyweight	Hold wall for balance, keep hips square, full swing
Leg Swing (side to side)	2 x 10 each	Bodyweight	Control the swing, do not let hips rotate with the leg
PVC Pipe Swing x5	3 x 5	PVC pipe	Load back hip, stride, rotate hips first then hands, full finish
Athletic PVC Pipe Swing x5	3 x 5	PVC pipe	Small hop to initiate momentum, land and rotate explosively, same finish

Med Ball Circuit — Hip Load Focus

Exercise	Sets x Reps	Load	Coaching Cue
Rotational Wall Throw	4 x 6 each	8-10 lb ball	Stand sideways to wall, load trail hip, rotate and throw hard, reset each rep
Hip Toss	4 x 6 each	8-10 lb ball	Load into back hip, drive hips toward target, release the ball at front hip, not shoulder
Scoop Toss	3 x 8 each	8 lb ball	Ball starts low, load hips, scoop upward using hip rotation not arms, throw to partner or wall
Half Kneeling Rotational Throw	3 x 8 each	8 lb ball	Trail knee down, isolates upper body rotation, drive through front hip, controlled reset
Med Ball Slam with Rotation	3 x 8	10 lb ball	Raise overhead, rotate and slam to opposite side, absorb with knees, reset and repeat

Workout 2 — Separation & Sequencing

Focus: hip to shoulder separation and proper sequencing. Power comes from rotating the lower half first and letting the upper half follow. Feel the stretch across your core before releasing.

Warm-Up & PVC Pipe Work

Exercise	Sets x Reps	Load	Coaching Cue
World's Greatest Stretch	2 x 5 each	Bodyweight	Lunge, elbow to ground, rotate and reach to sky, slow and deliberate
Thoracic Rotation (seated)	2 x 10 each	Bodyweight	Sit cross legged, hands behind head, rotate fully each direction
Hip 90/90 Stretch	2 x 30 sec each	Passive hold	Both legs at 90 degrees, sit tall, feel the hip stretch
PVC Pipe Swing x5	3 x 5	PVC pipe	Exaggerate the hip to shoulder separation, feel hips move before hands
Athletic PVC Pipe Swing x5	3 x 5	PVC pipe	Hop, land softly, hips fire first, upper body follows, aggressive finish

Med Ball Circuit — Separation Focus

Exercise	Sets x Reps	Load	Coaching Cue
Step and Throw	4 x 6 each	8-10 lb ball	Step toward wall, hips open first, shoulders follow, throw at chest height
Drop Step Rotational Throw	4 x 6 each	8-10 lb ball	Drop back foot, load, drive hips, throw — mimics exact swing sequence
Palloy Press with Rotation	3 x 10 each	Band or cable	Press out, hold, rotate away from anchor, feel core resist and then rotate
Overhead Rotational Slam	3 x 8 each	10 lb ball	Raise overhead, rotate and slam to each side alternating, explosive downswing
Partner Chest Pass with Twist	3 x 10 each	8 lb ball	Rotate away from partner, load, twist and chest pass explosively, partner catches and returns

Workout 3 — Explosive Finish & Extension

Focus: finishing the rotation with full extension and follow through. A powerful swing is not just about starting the rotation — it's about completing it. Every rep should finish with full hip extension and a balanced follow through.

Warm-Up & PVC Pipe Work

Exercise	Sets x Reps	Load	Coaching Cue
Lateral Band Walk	2 x 12 each	Light band	Stay low, controlled steps, keep hips level and core tight
Glute Bridge	2 x 12	Bodyweight	Drive hips up, squeeze glutes at top, hold 2 seconds, lower slow
Ankle Circles	2 x 10 each	Bodyweight	Maximize range, trace large slow circles, both directions
PVC Pipe Swing x5	3 x 5	PVC pipe	Focus on the finish — full hip extension, balanced follow through, hold finish 2 sec
Athletic PVC Pipe Swing x5	3 x 5	PVC pipe	Hop, aggressive rotation, complete the swing through contact zone, balanced finish

Med Ball Circuit — Extension & Finish Focus

Exercise	Sets x Reps	Load	Coaching Cue
Rotational Throw with Follow Through	4 x 6 each	8-10 lb ball	After release let body complete the rotation naturally, hold finish position 2 seconds
Broad Jump to Rotational Throw	4 x 5 each	8 lb ball	Jump forward, land, immediately rotate and throw — trains explosive transition
Single Leg Rotational Throw	3 x 6 each	8 lb ball	Balance on front leg, rotate and throw, challenges stability through the finish
Low to High Rotational Throw	3 x 8 each	8 lb ball	Start ball low outside hip, rotate and release high across body, mimics upswing path
Max Effort Wall Throw	4 x 4 each	10 lb ball	Full wind up, maximum effort rotation and release, reset fully between reps — quality over quantity
